

WA Marketer

Confirmed Bugs Fix Report

Production-safe fixes for the latest live testing report

Repository	github.com/su92-bsdsm-f24-038-hub/WA-marketer
Branch	main
Commit	d5eafcb - Fix confirmed WA Marketer bugs
Scope	BUG-01 through BUG-10 only
Date	2026-10-01

Delivery summary

All ten confirmed bugs were addressed in the current project folder and the complete project snapshot was pushed to the provided GitHub repository. The initial commit contains 111 project files. Existing ignore rules kept environment files, private keys, archives, and node_modules out of the repository.

Verification status

Targeted code checks, syntax checks, PDF/API harness checks, notification route checks, and consolidated static checks passed. Some browser- and provider-dependent checks remain for live verification because the available WhatsApp Web session was not authenticated.

1. Executive test summary

Area	Result	Notes
Code syntax	PASS	Changed JavaScript files and CRM bundle parsed successfully.
PDF extraction	PASS	Readable PDF, compressed PDF, and invalid PDF paths covered.
Transcription request	PASS	Mock request confirmed selected Urdu provider code is forwarded.
Notification routes	PASS	Create/history/dashboard mocks confirmed stored events and numeric totals.
Bug coverage	PASS	Consolidated static checks returned true for BUG-01 through BUG-10.
Live WhatsApp UI	PENDING	Requires authenticated WhatsApp Web and connected provider/CRM data.

2. Detailed bug fixes

BUG-01 - PDF files showed garbage text in Knowledge Base

HIGH

Feature	AI Settings > Data Sources > Knowledge Base
Root cause	PDF bytes were being treated as ordinary text. The UI could mark extraction successful even when the result was binary or unreadable.
What was fixed	Added PDF-aware stream/filter decoding and readable-text validation. Invalid PDFs and PDFs with no readable text now return an error state instead of storing raw bytes or showing false success.
How it was tested	Targeted Node harness covered plain-text PDF data, Flate-compressed PDF data, and invalid PDF input. The failure path returned HTTP 422 and no binary fallback.

BUG-02 - MP4 campaign video was sent as GIF without audio

HIGH

Feature	Campaigns > New Campaign > Attach Files
Root cause	The WhatsApp media payload enabled GIF/play-as-GIF mode for an MP4, which caused normal video and audio behavior to be lost.
What was fixed	Normal video sending now explicitly disables GIF mode with asGif: false. Existing media sending behavior remains unchanged for other file types.
How it was tested	Static payload inspection confirmed the MP4 path no longer enables GIF mode. Final audio playback still needs confirmation in an authenticated WhatsApp session.

BUG-03 - Contact Added flow trigger did not execute**HIGH**

Feature	Flows > Event > Contact Added
Root cause	Contact creation was not consistently emitting the event shape expected by the flow trigger matcher, so active listeners never matched the new contact event.
What was fixed	Aligned trigger matching with event and eventType values, dispatched contact-added data after successful contact creation, and propagated the event through the background/service path.
How it was tested	Static consolidated checks covered event emission, trigger matching, background propagation, persistence, and flow execution wiring. Live message delivery and counters need confirmation with a connected CRM/WhatsApp session.

BUG-04 - Voice transcription ignored the selected language**MEDIUM**

Feature	WhatsApp Web voice note transcription
Root cause	The selected application language was not reliably mapped to the provider language code or included in the transcription request.
What was fixed	Added supported language mappings and forwarded the selected provider code in the transcription request. Unsupported selections now produce a proper message instead of silently switching language.
How it was tested	A mocked transcription request confirmed that Urdu sends language: ur and preserves the selected model/request shape. Urdu and English audio quality require provider-backed live verification.

BUG-05 - Reply via AI setup popup appeared in Russian**MEDIUM**

Feature	WhatsApp side panel > Reply via AI
Root cause	The setup-required popup contained hardcoded Russian strings and did not use the extension localization namespace consistently.
What was fixed	Replaced hardcoded strings with localization keys and corrected the popup namespace so title, description, buttons, and wording follow the current application language.
How it was tested	Static checks confirmed the popup uses localization keys and has no hardcoded Russian setup text. Visual confirmation requires the authenticated side panel.

BUG-06 - Target language dropdown was almost invisible**MEDIUM**

Feature	Translate panel > Auto-translate > Target Language
Root cause	Light dropdown backgrounds were combined with very light text caused by inherited dark-theme styles.
What was fixed	Applied readable foreground/background colors, light color scheme, and readable option/selected states for normal and hover interactions.
How it was tested	Static style checks confirmed explicit readable colors and light color-scheme handling. Final visual selection check requires the authenticated WhatsApp side panel.

BUG-07 - Oversized file upload failed silently**MEDIUM**

Feature	Campaigns > New Campaign > Attach Files
Root cause	The upload handler rejected files above the limit without updating the visible attachment error state.
What was fixed	Added pre-upload 30 MB validation and a clear message: File is too large. Maximum file size is 30 MB. Valid files continue through the existing upload path.
How it was tested	Static checks confirmed the exact limit and error path are wired before upload. Boundary testing should be repeated in the deployed UI with below-limit, near-limit, and above-limit files.

BUG-08 - Create Flow form silently refused invalid submissions**MEDIUM**

Feature	Flows > Create Flow
Root cause	Required-field validation was not surfaced to the user; the save path could stop without visible field-level feedback.
What was fixed	Enabled the validation path, added visible inline errors/highlights for name, trigger, steps, and step-specific fields, and prevented saving until required values are valid.
How it was tested	Static checks confirmed required flow validation and visible error rendering. Final focus/scroll behavior should be checked in the deployed CRM UI.

BUG-09 - Notification History was empty and showed undefined events

MEDIUM

Feature	Notifications > Bell icon > View All Notifications
Root cause	Activity records were not consistently persisted/read by the history route, and the page rendered an undefined total. Manual campaigns also reused scheduled-campaign wording.
What was fixed	Added persistent activity storage and history retrieval, numeric total/totalPages values, dashboard feed integration, and correct manual-versus-scheduled campaign descriptions.
How it was tested	Mocked route tests confirmed create/history/dashboard behavior, numeric counts, stored events, and manual campaign wording. Live bell/history synchronization needs deployed-session verification.

BUG-10 - Variation button gave no response

LOW

Feature	WhatsApp side panel > Marketing > Preview > Variation
Root cause	The button had no visible result when no valid variation syntax existed, leaving the user without feedback.
What was fixed	Added variation preview feedback for valid syntax and a clear No message variations found. message when plain text has no variation groups.
How it was tested	Static checks covered plain text and {Hi Hello Hey} there behavior. Final click-through should be confirmed in the authenticated side panel.

3. Files changed

The repository push includes the complete project snapshot. The principal implementation files touched for these fixes are:

- local-backend.js - PDF extraction and notification persistence/history
- wa-bulk-page.js - normal MP4 video payload
- background.js - CRM contact event propagation
- ai-providers.js, options.html, options.js - transcription language mapping and settings
- content.js - localization, translate dropdown styling, Variation feedback
- bulk.html, bulk.js - upload size validation and campaign upload feedback
- crm/assets/index-CqxXB6Pu.js - Contact Added trigger matching and Create Flow validation

4. Repository handoff

GitHub	Open WA-marketer repository
Pushed branch	main
Commit hash	d5eafcba2ae50eaceeb807a7339c8214b8e21b09

5. Remaining live verification

The code and targeted checks are complete. The following items should still be exercised in the live deployed environment: MP4 audio playback in WhatsApp, Contact Added flow message delivery and counters, Urdu/English provider transcription quality, localized Reply via AI popup, translate dropdown visual states, 30 MB upload boundaries, Create Flow focus/scroll behavior, live notification bell/history synchronization, and Variation button click-through in the authenticated side panel.

These are verification items, not newly discovered bugs. The available browser session could not complete them because WhatsApp Web was not authenticated.
